Holded Holded connection module 	<div style="border: 2px solid black; padding: 10px; text-align: center;"> MTS MTS extensions modules  Microsoft Teams NEW </div>		

Multitenant Issabel Architecture

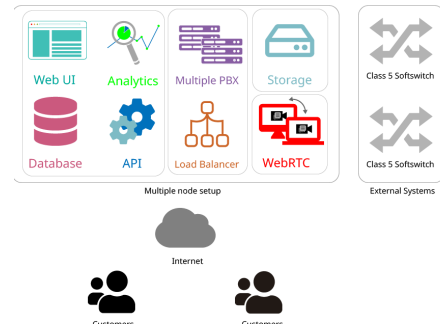

Simple Node

Issabel Multitenant in only one virtual node has all components required.

Recommended up to 1000 extensions and can become one multi-node architecture at any moment.

Multi Node

Multi-node architecture uses several virtual machines to enhance its capacity.

This kind of deployment allow to horizontally scale enabling more PBX nodes and keeping only one management point.

What's New

[Improvement] User-Extension Separation

- In the past a user had 1 SIP extension and 0-1 GSM extensions. You can now have 0-N extensions of any type.
- User preferences like forwarding have been migrated to extension preferences. This way you can control the behavior individually.

[New][Module] Microsoft Teams Extensions (MST)

- **The PBX has an integrated SBC for MST extensions. Users with Teams extensions with the corresponding Microsoft license can use the PBX to make and receive calls.**
- **There is no need to purchase additional licenses on the PBX. MST extensions use the same licenses as other extensions.**
- **MST extensions are treated the same as other extensions. The operation is transparent to the user.**
- **Note: Some configuration is required on the Microsoft side. The PBX will not ask the administrator for Microsoft credentials. This is done for security reasons. The system provides a configuration wizard that will guide the Admin through the entire process. Although this decision makes the initial configuration of the module somewhat more tedious, it is something that only needs to be done once and we believe that the security advantages outweigh the disadvantages of a manual configuration.**

[Improvement] The Webphone allows you to choose the SIP extension to use at all times.

[Upgrade] Kamailio has been updated to version 5.6

[Upgrade] Nodejs has been updated to version 18

[Improvement] Queue Pause Log

- **The pauses in the queue are saved in a record that can be consulted and filtered from the web and from the API.**

[Improvement] The forwarding to destination and mailbox have been unified. The mailbox is treated as another destination.

[Improvement] SBC CDRs can be downloaded in CSV format.

[Improvement] Background processes for web panel

- Some processes have been delegated to background processes to improve panel responsiveness.

[Improvement] Asterisk dialplan refactoring (another one.

- **odbc variables and queries have been renamed for consistency**
- **The dialplan has been refactored into more contexts and files to make it cleaner and more maintainable**
- **Note: Custom patches have to be revised to adapt them to the new policy.**

[Improvement] Users can call any extension of other group companies, not just user extensions.

[New] Implemented the code *67 for anonymous calls.

[New] New UserData field in cdr to store arbitrary information.

[Bugfix] Many bugs have been fixed. Some new ones have been introduced :)
